THE BEST IN COST,
REACH AND
BUSINESS
CONTINUITY**

**SYNCHRONIZE USING ANY
FORM OF IP CONNECTIVITY :**

- LAN
- WIFI
- CELLULAR
- WIMAX
- SATELLITE

AGENTRY MOBILE PLATFORM: COMMUNICATIONS

Syclo's Agentry mobile platform features an advanced communications framework that brings you the best in business continuity, speed and cost-effectiveness. From 100 percent availability in a fully disconnected mode to least-cost routing to robust security features, Agentry pairs extreme flexibility with robust performance for your toughest implementations.

WORK ONLINE OR OFFLINE

Most mobile solutions are only as good as the networks supporting them. Agentry is better. Your Syclo applications are deployed using a rich client approach that houses all business logic and application data right on the device. Synchronization can happen quietly in the background when users are in coverage — but work continues uninterrupted when they're not. The application retains its full depth of functionality and quality of user experience regardless of connectivity.

CONNECT USING A VARIETY OF NETWORKS

Agentry also gives you great flexibility in choosing your communication methods. You can now configure your mobile application around your needs for reach, cost-effectiveness and frequency of synchronization. Some Syclo customers simply dock their devices at the end of the day to upload a shift's worth of data and get new assignments. Others require real-time communication for urgent service orders, up-to-date inventory information and proof of delivery. Syclo supports all IP communication methods from LAN to satellite, allowing you to accommodate your most demanding users and business processes.

SAVE MONEY WITH LEAST- COST ROUTING

Fortunately, you don't have to choose a single connection method. Agentry's built-in adaptive communications feature set lets you set up granular business rules for what you want to send, when and over what network. Minimize your WAN traffic and expenditures by only using these networks to transfer time-sensitive data. Synchronize the rest over free networks at your depot, warehouse or control room. Your users don't even have to know what's going on: Agentry will seamlessly handle network handovers in the background.

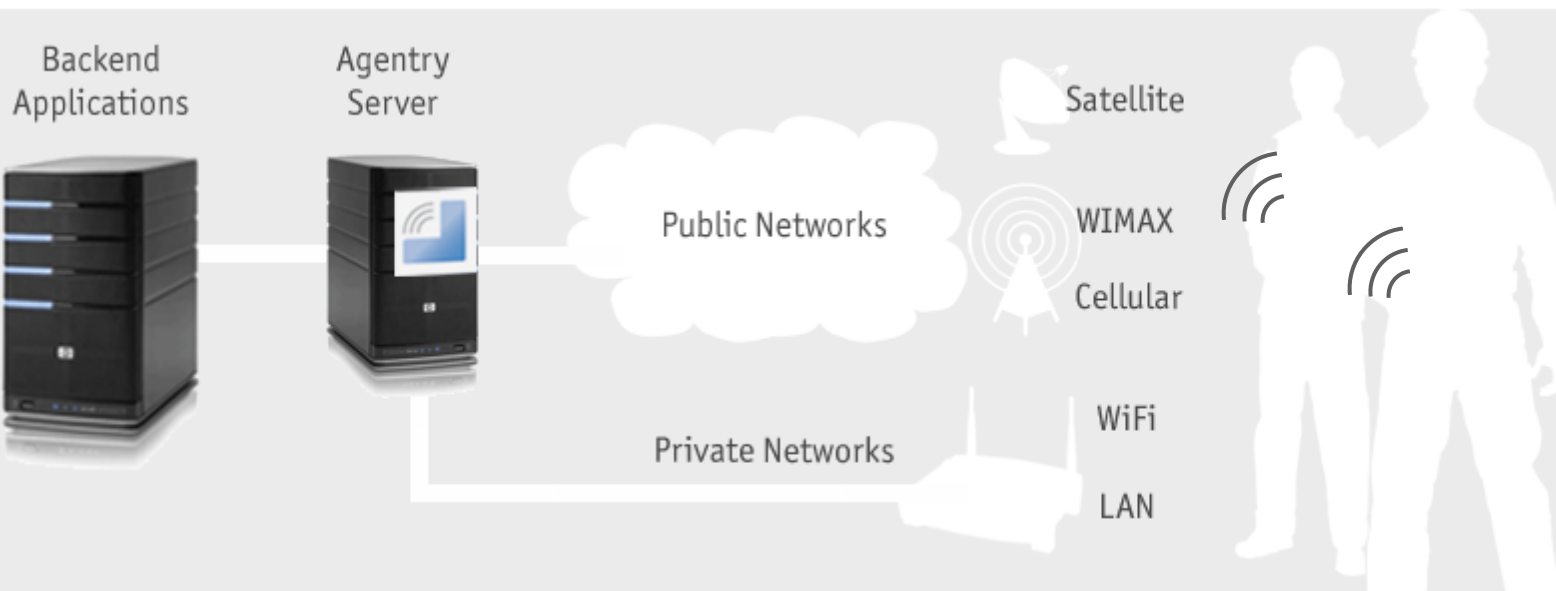

IMPROVE PERFORMANCE BY SENDING LESS DATA

Agentry further helps you contain costs and improve performance of your mobile applications by sending the least possible amount of data. Its built-in data reduction mechanisms ensure that only the differences in data and application definitions are synchronized. Agentry then compresses this information before sending it over the network of your choice.

The result? Lower connectivity costs, less battery-draining radio use and less overhead for your mobile devices' processors.

EXTREME CONNECTION FLEXIBILITY

STAY UP TO DATE WITH PUSH AND PULL SYNCHRONIZATION

What causes your mobile application to synchronize is entirely up to you. It can be driven by the user, a predefined set of transactions executed on the mobile device or a lapse of a certain time period. What sets Agentry apart, however, is the ability to automatically push out updates as changes occur in your backend applications data.

Based on a service-oriented architecture (SOA), Agentry is designed to detect activity such as new work orders, status updates, changes in inventory levels and other events. By doing this, Agentry can automatically initiate a connection to the mobile device if a relevant change is

detected. You, of course, have complete control over what classifies as a relevant change (by user group), letting you instantaneously dispatch urgent work orders and keep critical information up to date on users' devices.

KEEP YOUR DATA SECURE

With clients like the Pentagon, US Navy and NASA, information security is always on top of our mind. Syclo has engineered Agentry to keep your data secure every step of the way, from your enterprise system to the mobile device and back.

Encrypt your data over the air using 128-bit encryption, SSL and TLS. Configure your mobile solution to send sensitive data only over private networks. Use any form of connectivity to remotely wipe the device and any attached data stores. Encrypt your data on the device. These are just a few of the features that help you keep your data secure and your stakeholders satisfied.
